Nursing Diagnoses 2009-2011, Custom NANDA International, 2010-06-11 A nursing diagnosis is defined as a clinical judgement about individual, family or community responses to actual or potential health problems or life processes which provide the basis for selection of nursing interventions to achieve outcomes for which the nurse is accountable. Accurate and valid nursing diagnoses guide the selection of interventions that are likely to produce the desired treatment effects and determine nurse-sensitive outcomes. Nursing diagnoses are seen as key to the future of evidence-based, professionally-led nursing care - and to more effectively meeting the need of patients and ensuring patient safety. In an era of increasing electronic patient health records standardized nursing terminologies such as NANDA, NIC and NOC provide a means of collecting nursing data that are systematically analyzed within and across healthcare organizations and provide essential data for cost/benefit analysis and clinical audit. 'Nursing Diagnoses: Definitions and Classification' is the definitive guide to nursing diagnoses worldwide. Each nursing diagnosis undergoes a rigorous assessment process by NANDA-I with stringent criteria to indicate the strength of the underlying level of evidence. Each diagnosis comprises a label or name for the diagnosis and a definition. Actual diagnoses include defining characteristics and related factors. Risk diagnoses include risk factors. Many diagnoses are further qualified by terms such as effective, ineffective, impaired, imbalanced, readiness for, disturbed, decreased etc. The 2009-2011 edition is arranged by concept according to Taxonomy II domains (i.e. Health promotion, Nutrition, Elimination and Exchange, Activity/Rest, Perception/Cognition, Self-Perception, Role Relationships, Sexuality, Coping/ Stress Tolerance, Life Principles, Safety/Protection, Comfort, Growth/Development). The book contains new chapters on 'Critical judgement and assessment' and 'How to identify appropriate diagnoses' and core references for all nursing diagnoses. A companion website hosts NANDA-I position statements, new PowerPoint slides, and FAQs for students.

Fragility Fracture Nursing Karen Hertz, Julie Santy-Tomlinson, 2018-06-15 This open access book aims to provide a comprehensive but practical overview of the knowledge required for the assessment and management of the older adult with or at risk of fragility fracture. It considers this from the perspectives of all of the settings in which this group of patients receive nursing care. Globally, a fragility fracture is estimated to occur every 3 seconds. This amounts to 25 000 fractures per day or 9 million per year. The financial costs are reported to be: 32 billion EUR per year in Europe and 20 billion USD in the United States. As the population of China ages, the cost of hip fracture care there is likely to reach 1.25 billion USD by 2020 and 265 billion by 2050 (International Osteoporosis Foundation 2016). Consequently, the need for nursing for patients with fragility fracture across the world is immense. Fragility fracture is one of the foremost challenges for health care providers, and the impact of each one of those expected 9 million hip fractures is significant pain, disability, reduced quality of life, loss of independence and decreased life expectancy. There is a need for coordinated, multi-disciplinary models of care for secondary fracture prevention based on the increasing evidence that such models make a difference. There is also a need

to promote and facilitate high quality, evidence-based effective care to those who suffer a fragility fracture with a focus on the best outcomes for recovery, rehabilitation and secondary prevention of further fracture. The care community has to understand better the experience of fragility fracture from the perspective of the patient so that direct improvements in care can be based on the perspectives of the users. This book supports these needs by providing a comprehensive approach to nursing practice in fragility fracture care.
